

EDF GEH

Year	2013			
Location	SAUVIAT - 63 - France			
Sector	Energy			
Field	Sound Insulation			
Type	Ventilation System			
Amount	1k€	10k€	100k€	1M€

The group 1 of the SAUVIAT plant owns an acoustic enclosure that dates from the creation of the plant. There were overheating issues and it was necessary to **upgrade the ventilation system** of the groups.

In the interests of the energy management, dB Vib proposed a **ventilation system with a Summer/Winter air by-pass**, allowing to recycle the calories released by the group for heating the plant during the cold periods. In summer season, the release is made from the building front.

EDF has entrusted dB Vib Ingénierie with the supply of all equipments **as turnkey operation**.
